Random Search Selector System

The Random Search Selector system makes the gate check easier and statistically acceptable. It is easy to install, simple to use and has many convenience features. All essential operating parameters are freely programmed and the settings can be changed easily. The RPS210 Random Selector unit forms a fully usable system together with the ASM121 power supply, and can be more versatile with optional accessories.

Components of the Random Search Selector System:

The Random search selector is a security device and a permanent deterrent in any place or events, where there is a need to search or screen people or vehicles for safety reasons, without the cost, time and inconvenience of stopping everyone. Random search selection generator gives randomly and unpredictably pass or stop signs according to the setting of the desired percentage (search ratio) between 0,5-99,5%.

The ASM121 power supply is plugged into the selector unit and provides enough energy for the accessories that are connected. It also meets today's requirements in terms of safety and energy efficiency.

With the help of the ECR202 radio remote control, the random person selector has additional useful functions by overriding the base equipment. A suspicious person can be chosen for serach prior to the checkpoint, thus claims of discriminaton (personal dislike, racism, etc..) are eliminated towards the security personnel.
